

LANGUAGE LEARNING IN CHILDREN WITH AUTISM

A STORY OF MANY PATHS TO LANGUAGE DEVELOPMENT

This presentation will explore current research regarding how autistic children develop language. Research shows that autistic individuals demonstrate unique learning and memory mechanisms for language, suggesting a need for a shift in language intervention strategies for autistic individuals. Participants will leave this presentation with a better understanding of autistic language development, resources for supporting their child's language development, and information regarding how to participate in current language development research.

THURSDAY, NOV 16
7:00-8:30 PM VIA ZOOM
